Quiz- Standard 14

Due Date ..... TODO
Name ..... **John Blackburn**
Student ID **Jobl2177**

Contents

1 Instructions

- The solutions **should be typed**, using proper mathematical notation. We cannot accept hand-written solutions. Here's a short intro to LaTeX.
- You should submit your work through the **class Canvas page** only. Please submit one PDF file, compiled using this LaTeX template.
- You may not need a full page for your solutions; pagebreaks are there to help Gradescope automatically find where each problem is. Even if you do not attempt every problem, please submit this document with no fewer pages than the blank template (or Gradescope has issues with it).
- You **may not collaborate with other students**. **Copying from any source is an Honor Code violation. Furthermore, all submissions must be in your own words and reflect your understanding of the material.** If there is any confusion about this policy, it is your responsibility to clarify before the due date.
- Posting to **any** service including, but not limited to Chegg, Discord, Reddit, StackExchange, etc., for help on an assignment is a violation of the Honor Code.
- You **must** virtually sign the Honor Code (see Section 2). Failure to do so will result in your assignment not being graded.

2 Honor Code (Make Sure to Virtually Sign)

Problem 1.

- My submission is in my own words and reflects my understanding of the material.
- I have not collaborated with any other person.
- I have not posted to external services including, but not limited to Chegg, Discord, Reddit, StackExchange, etc.
- I have neither copied nor provided others solutions they can copy.

Agreed John Blackburn. □

3 Standard 14- Analyzing Code I: Nested Independent Loops

Problem 2. Analyze the *worst-case* runtime of the following algorithm. Clearly derive the runtime complexity function $T(n)$ for this algorithm, and then find a tight asymptotic bound for $T(n)$ (that is, find a function $f(n)$ such that $T(n) \in \Theta(f(n))$). Avoid heuristic arguments from 2270/2824 such as multiplying the complexities of nested loops. [**Note:** $A[1,\ldots,n][1,\ldots,m]$ is a two-dimensional array with row indices in $\{1,\ldots,n\}$ and column indices in $\{1,\ldots,m\}$.]

Assume that $A[i][j]$ takes 2 steps, one for accessing $A[i]$ and a second for accessing the jth element of $A[i]$.

Algorithm 1 Nested Independent Loops

```
1: procedure FOO1(A[1,...,n][1,...,n])
2:     for i ← 1; i ≤ n; i ← i + 1 do
3:         for j ← 1; j ≤ n; j ← j + 1 do
4:             for k ← 1; k ≤ n; k ← k * 2 do
5:                 if A[i][k] + A[k][j] ≤ A[i][j] then
6:                     print A[i][j]
```

Answer. I'll start with the inner most loop To this end, we begin with analyzing the k-loop. the k-loop takes 1 step to initialize $k \to 1$. Let k denote the number of iterations of the k loop. The loop terminates when $2^k > n$. Solving for k, we obtain that: $k > \log_2(n)$. As the loop takes at least one iteration to compare k to n, we have that the loop takes $\log_2(n) + 1$ iterations. At each iteration, the loop does the following: – The comparison $k \leq n$ takes 1 step. – The update $k \to k * 2$ takes 2 steps: one step to evaluate $k * 2$ and one step for the assignment. – The body of the loop consists of a if statement that contains a single print statement, which takes 8 steps for the if statement and 3 for the print statement So the runtime complexity of the k-loop is:

$1 + \sum_{k=1}^{\log_2(n)+1} 14 = 1 + 14\log_2(n) + 14$

Now for the next loop, j 1 step to init j to 1, the loop will run n times,

– The comparison $j \leq n$ takes 1 step. – The update $j \to j + 1$ takes 2 steps: one step to evaluate $j + 1$ and one step for the assignment. – The body the j-loop consists solely of the k-loop.

So the runtime is:

$1 + \sum_{j=1}^{n}(3 + 1 + 14\log_2(n) + 14) = 1 + n(3 + 1 + 14\log_2(n) + 14) = 1 + 18n + 14n\log_2(n)$

Now for the final outer loop, loop i 1 step to init i, the loop runs n times

– The comparison $i \leq n$ takes 1 step. – The update $i \to i + 1$ takes 2 steps: one step to evaluate $i + 1$ and one step for the assignment. – The body the i-loop consists solely of the j-loop.

So, the runtime is :

$1 + \sum_{i=1}^{n}(3 + 1 + 18n + 14n\log_2(n)) = 1 + n(3 + 1 + 18n + 14n\log_2(n)) = 1 + 4n + 18n^2 + 14n^2\log_2(n)$

this completes $T(n)) = 1 + 4n + 18n^2 + 14n^2\log_2(n)$

So now to find big theta we can take the highest order term and get:

$T(n) \in \theta(n^2\log_2(n))$

□
