
Quiz 8 - Prim's Algorithm

Due Date TODO
 Name **John Blackburn**
 Student ID **jobl2177**

Contents

1	Instructions	1
2	Honor Code (Make Sure to Virtually Sign)	2
3	Standard 8 - Prim's Algorithm	3
3.1	Problem 2	3

1 Instructions

- The solutions **should be typed**, using proper mathematical notation. We cannot accept hand-written solutions. Here's a short intro to L^AT_EX.
- You should submit your work through the **class Canvas page** only. Please submit one PDF file, compiled using this L^AT_EX template.
- You may not need a full page for your solutions; pagebreaks are there to help Gradescope automatically find where each problem is. Even if you do not attempt every problem, please submit this document with no fewer pages than the blank template (or Gradescope has issues with it).
- You **may not collaborate with other students**. **Copying from any source is an Honor Code violation. Furthermore, all submissions must be in your own words and reflect your understanding of the material.** If there is any confusion about this policy, it is your responsibility to clarify before the due date.
- Posting to **any** service including, but not limited to Chegg, Discord, Reddit, StackExchange, etc., for help on an assignment is a violation of the Honor Code.
- You **must** virtually sign the Honor Code (see Section 2). Failure to do so will result in your assignment not being graded.

2 Honor Code (Make Sure to Virtually Sign)

Problem 1. • My submission is in my own words and reflects my understanding of the material.

- Any collaborations and external sources have been clearly cited in this document.
- I have not posted to external services including, but not limited to Chegg, Reddit, StackExchange, etc.
- I have neither copied nor provided others solutions they can copy.

Agreed (John Blackburn).

3 Standard 8 - Prim's Algorithm

3.1 Problem 2

Problem 2. Consider the following graph $G(V, E, w)$. Clearly indicate the order in which Prim's algorithm adds the edges to the minimum-weight spanning tree **using F as the source vertex**. You may simply list the order of the edges; it is not necessary to exhibit the state of the algorithm at each iteration.

Proof. The first edge Prim's adds is $\{E, F\}$. Then $\{B, E\}$. Then $\{A, B\}$. Then $\{D, E\}$. It is worth noting that it could've added $\{B, D\}$ instead of $\{D, E\}$ because they are of the same weight and connected to the current MWST, it just depends on how the queue would've sorted it. I have chosen $\{D, E\}$ for my purposes. The final edge added that completes the MWST is $\{C, E\}$.
